

J1

IMPLANT SYSTEM

J1

IMPLANT SYSTEM

- Increased osseointegration in the cortical bone
- Decreased marginal bone loss
- Powerful self threading design
- Cutting edge with excellent self-tapping force
- Tapered thread and double-tapered shape enable excellent initial bonding stability with soft bone

● Flow Chart For J1 System

One Body

- Implant suitable for narrow space like maxillary anterior tooth
- RBM surface is adopted for fast osseointegration
- Optimization of Body Design, Thread Design, and Drill for increase of early fixed force and bone penetrating ability
- Implant torque : 30Ncm

Diameter	Length	REF

Mini Post

- Implant used to mount temporary prosthesis to entire or partial edentulous patients
- Application of square angle structure which connects driver at the bottom of neck
- Optimization of Body Design, Thread Design, and Drill for increase of early fixed force and bone penetrating ability
- Implant torque : 30Ncm

O-Ring

- Denture type implant used when bone width is narrow or it's difficult to apply general implant to edentulous patient
- Easy to make denture using retainer and lab analog
- Ball Type structure for connection of O-Ring Attachment
- Implant torque : 30Ncm

Diameter	Height	REF

Abutment

- Used for making general cemented-type prosthesis
- Tapered body design facilitating prosthetic fit
- Cross-section design for the prevention of prosthesis rotation
- Use for the path adjustment of prosthesis
- O-ring and post type implant connected to the abutment

Straight Abutment
